Hello,

The following submission has been created.

Track Name: Engineering sciences

Paper ID: 69

Paper Title: Impact of Content Recommendation Systems on User Polarization

Abstract:
Content recommendation systems have become integral to modern social media platforms, significantly influencing how users consume information and form opinions. While these systems are designed to maximise user engagement through personalised content, they may contribute to the formation of echo chambers and increased user polarisation . This study examines the impact of two recommendation strategies—engagement-based and diversity-based—on user polarisation . Using publicly available datasets from Reddit and Twitter, we apply data preprocessing and sentiment analysis techniques to evaluate user opinions. We then simulate both recommendation approaches and assess their effects using sentiment variance and average sentiment as quantitative metrics. The results demonstrate that engagement-based recommendation systems tend to increase polarisation by reinforcing similar viewpoints, whereas diversity-based systems promote exposure to varied perspectives and reduce polarisation . These findings emphasise the need for designing balanced recommendation frameworks that can sustain user engagement while minimising ing polarisation and encouraging diverse information consumption.
